Raw Data Access

The first step in this project involves extracting raw data directly from the PostgreSQL source.

- **Source**: PostgreSQL

- **Connection string**:

  postgres://Test:bQNxVzJL4g6u@ep-noisy-flower-846766.us-east-2.aws.neon.tech/TravelTide?sslmode=require

From this connection, the following datasets were retrieved and stored as CSV files for further analysis:

- **user**

- **flights**

- **hotels**

- **sessions**

I am generating this content file and have also uploaded the raw text files extracted via the Python script to my Google Drive. If the Drive link does not work, you can directly connect using the above string for raw data. The Python script for fetching raw data and saving it to Drive has also been provided.
